

## Fundamental of Structured Programming Using C++

Please attempt ALL questions, **separate them clearly**, and think before you write.

QUESTION (1)		(40 points)
1.1 Type True/False in front of each statement and <b>CORRECT</b> the false ones. Use the following template table for your answer.		
<b>Answer</b>	<b>Correction of False statements</b>	
1.1. True/False	...	
1.2. True/False	...	
(1) The Compiler is responsible to detect syntax errors. ( )		
(2) According to Visual Studio compiler, this code is correct: <i>int size=5, myArr[size]={0};</i> ( )		
(3) Every recursive function requires a recursive case as well as a base case to stop recursion. ( )		
(4) The following code segment is correct. <pre> <b>struct</b> Date{ <b>int</b> year; <b>int</b> month; <b>int</b> day;}; <b>struct</b> Person{ <b>char</b> name[10]; Date birthDay;}; <b>void</b> main(){ Person Bill;cin&gt;&gt;Bill.name;} </pre> ( )		
(5) It's a type mismatch to assign an integer variable to an integer pointer variable. ( )		
(6) The statement <pre> <b>struct</b> my_struct { <b>int</b> num1, num2; <b>char</b> signs[4];double result;}; </pre> allocates 20 bytes in memory. ( )		
(7) To use a built-in function defined in an external library you need just to call the function. ( )		
(8) When declaring 2D array we should specify at least the first dimension. ( )		
(9) Every iterative function can be solved by recursion. ( )		
(10) Variables passed in a function call are called formal parameters while the ones declared in function header are called function arguments. ( )		

QUESTION (2)		(20 points)
Choose the correct answer (ONLY ONE). (5 points each) PLEASE FOLLOW THIS ANSWER FORMAT:		
<b>Question Number</b>	<b>Answer</b>	
3.1	Your choice letter	
3.2	Your choice letter	
...	...	

(1) What is the output of the following code fragment?

```
1 #include <iostream>
2 using namespace std;
3
4 int main()
5 {
6     int a; int b;
7     int* p; int* q;
8     a = 3;
9     p = &a;
10    q = p;
11    b = 4;
12    *q = b;
13    cout<<*p<<"\t"<<a<<endl;
14
15    return 0;
16 }
```

- (a) 4 4      (b) 4 3  
(c) 3 3      (d) 3 4  
(e) Garbage 3

(2) What is the output of the following code fragment?

```
1 #include <iostream>
2 using namespace std;
3
4 int main()
5 {
6     int * intVarPtr;
7     intVarPtr = new int;
8     *intVarPtr = 500;
9     int * intVarPtr2 = intVarPtr;
10    delete intVarPtr2;
11    cout<<*intVarPtr<<endl;
12
13    return 0;
14 }
```

- (a) 500      (b) 00000000  
(c) Run time Error.      (d) Garbage.  
(e) Syntax Error.

(3) Where can you NOT declare a variable in a C++ program?

- (a) Within the parameter list of a function definition.  
(b) Within the block of a function body.  
(c) Within the argument list of a function call.  
(d) Outside of any function.  
(e) None of the above.

(4) Arrays are passed as parameters to functions via

- (a) Passing by reference.  
(b) Passing by value.  
(c) Can use (a) or (b)  
(d) We cannot pass arrays as parameters.  
(e) None of the above.

(5) The following statements:

`int a[10] = {1,2}, b[10] = {}; a = b;`

- (a) Assigns all values of elements of a to elements of b.  
(b) Assigns non-zero values from elements of a to elements of b.  
(c) Assigns all values of elements of b to elements of a.  
(d) Incorrect expression so no values are assigned.  
(e) Makes the two variables point to the same address.

### QUESTION (3)

(25 points)

Answer the following questions

(a) What is the output of the following code fragment?

```
5 void main()
6 {
7     char s[]="bob";
8     bool test=false;
9     char x[5];
10    strcpy(x,s);
11    strrev(s);
12    if(strcmp(s,x)==0)
13        cout<<"Yes";
14    else
15        cout<<"No";
16    cout<<endl;
17 }
```

(b) What is the output of the following code fragment?

```
3 int compute(int a, int b, int c, double& d)
4 {
5     d = (a+b+c)/3.0;
6     return a+b+c;
7 } // end compute
8 void main()
9 {
10    double x;
11    int y=compute(10,20,30,x);
12    cout<<x<<"\t"<<y<<endl;
13    y=compute(1.5,2,3.5,x);
14    cout<<x<<"\t"<<y<<endl;
15 }
```

(c) The following code outputs the sum of the 2d array: 21. Modify it to output the sum of row by row: 6 and 15 . (Write down the line number having the modification and the correct statement(s))

```
int sum = 0;
int arr[2][3]={{1,2,3},{4,5,6}};
for(int i= 0; i< 2; i++)
{
    for(int j = 0; j < 3; j++)
    {
        sum += arr[i][j] ;
    }
}
cout<<sum<<endl;
```

(d) Correct the code error(s) of Power function to be solved recursively. (Write down the line number having the error(s) and the correct statement )

```
8 } // end main
9 int my_Power(int base, int power)
0 {
1     if (power==0)
2         return 1;
3     if(power == 1)
4         return base;
5     return my_Power(base-1, power-1);
6 }
```

(e) Write down the expected output of the following pseudo-code if we input (5, 3,7,2,9)

```
do
    swapped = false
    for i = 0 to indexOfLastUnsortedElement-1
        if leftElement > rightElement
            swap(leftElement, rightElement)
            swapped = true
        ENDF
    ENDFOR
    while swapped
    ENDDO
```

#### QUESTION (4)

(40 points)

**Problem:** an integer N is “perfect” if N is equal to the sum of the positive integers K such that  $K < N$  and K is a divisor of N.

*Example: 6, because 1, 2, and 3 are its proper positive divisors, and  $1 + 2 + 3 = 6$ .*

(a) Use **top-down** approach to design a solution to determine if a given integer is “perfect”.

(b) Write the definition of a C++ function `bool perfect (int) ;` that decides if a given integer is perfect or not.

(c) Write a complete program to solve the Problem using the function **perfect** that you just defined in (b).

(d) Add to your code an overloaded function that returns also the divisors of the given integer.

Best Wishes ☺

Prof. Zaki Taha
